
Regional Gaps on Municipal Educational Performance in Colombia, 2007-2012

XII Seminario de la Revista *Ensayos de Sobre Política Económica*
Bogotá, October 22-23, 2015

*Guillermo David Hincapié Vélez
Osmar Leandro Loaiza Quintero*

Universidad Nacional de Colombia, Medellín

We are grateful to ICFES --a public institution in charge of monitoring primary and secondary education in Colombia-- and to Universidad Nacional de Colombia. Both institutions sponsored the research project “Convergencia espacial en el rendimiento educativo en Colombia, 2000-2012”. The results shown here are derived from that research project.

Introduction

- The empirical and theoretical literature on the field of economics stresses the positive impact of education on individual's income, and on the economic performance of countries and regions.
- Thus, regional disparities as reflected by the gaps in income level or life quality might be highly related to regional gaps on education.
- The purpose of this paper is to determine if there are regional differences in municipal educational quality in Colombia, as measured through a standardized test applied to high school senior students in the period 2007-2012.
 - Also, it will determine the neighbourhood effect on the probability of a given municipality to move up in the (empirical) distribution of municipal education quality

Research Questions

- Is there any evidence of convergence in municipal education quality in Colombia between 2007 and 2012?
- What is the probability of any given municipality of moving up or moving down in the distribution of education quality?
- What is the probability of a municipality of moving up or moving down in terms of education quality, given the position of its neighbours?
 - Are there convergence clubs in municipal education quality?

Methodology

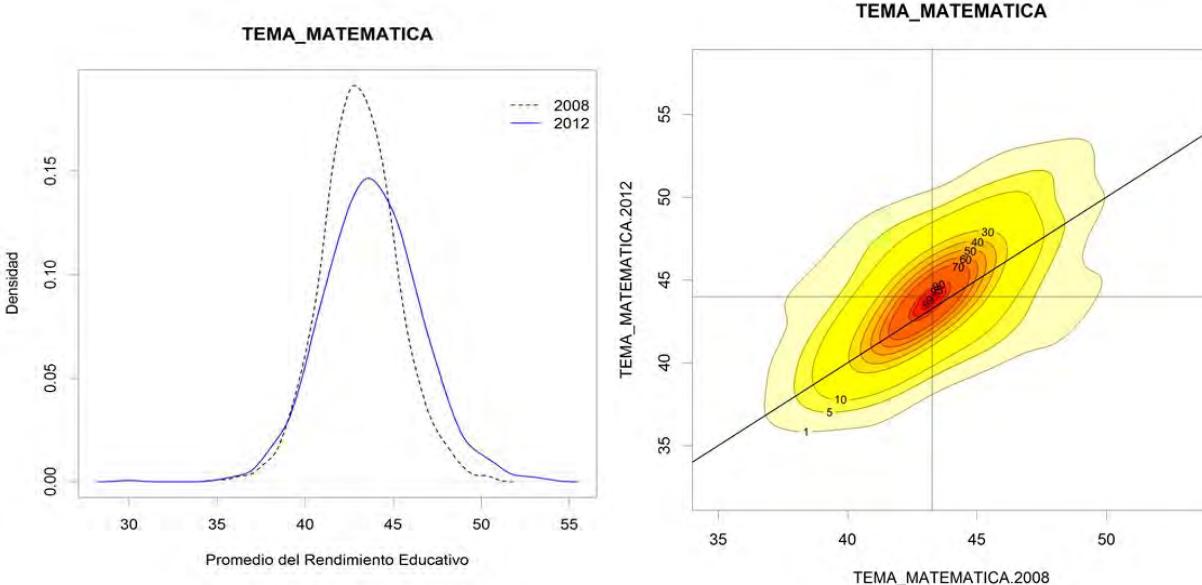

- Stochastic Kernel Distributions
- Classic Markov Probability Matrices
- Univariate and bivariate ESDA (Exploratory Data Analysis)
- Spatial Markov Probability Matrices

Data

We use the results at the municipal level of a standardized test applied to senior high school students in Colombia as a measure of education quality. This standardized test encompasses six basic subjects: biology, chemistry, physics, philosophy, math and language.

For the sake of brevity, we will focus mainly on the analysis carried out on the math test.

Kernel Distributions: Math

Nationwide, there is a slight increase in the overall municipal education quality, as the classic kernel distribution shifts to the right. Nonetheless, at the same time the distribution flattens, implying that there is an increased dispersion and that tails gain weight. These are clear signs of divergence.

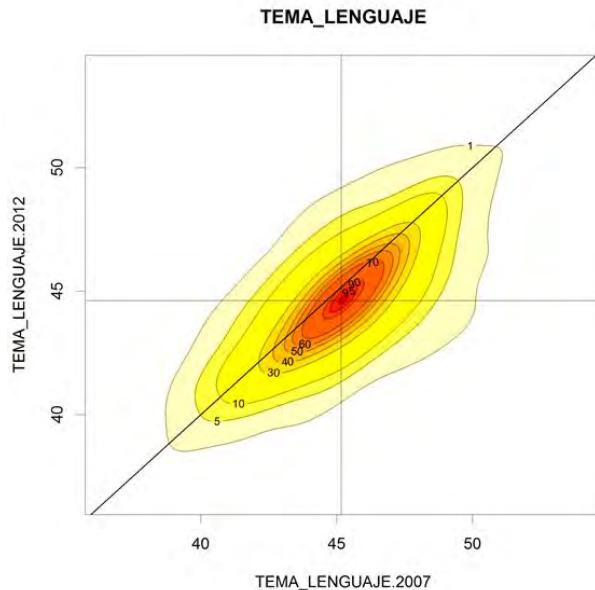

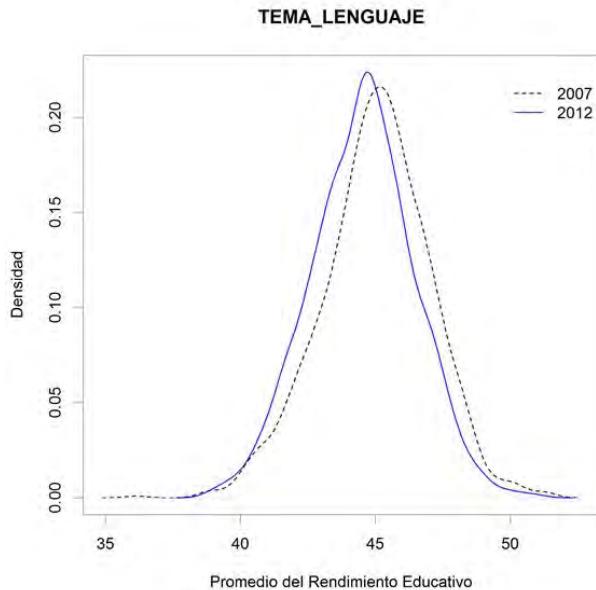

Moreover, the kernel contour map shows that those municipalities with an initial advantage are widening their lead.

Classic Markov Matrix: Math period (2008-2012)

| MATHEMATICS | | 1 | 2 | 3 | 4 | 5 |
|------------------------|------------------|----------|--------------------|----------|----------|---|
| Probability Matrix | | | | | | |
| 1 | 0.584746 | 0.263771 | 0.092161 | 0.038136 | 0.021186 | |
| 2 | 0.271889 | 0.307604 | 0.228111 | 0.134793 | 0.057604 | |
| 3 | 0.09881 | 0.241667 | 0.270238 | 0.261905 | 0.127381 | |
| 4 | 0.045455 | 0.093434 | 0.222222 | 0.34596 | 0.292929 | |
| 5 | 0.021592 | 0.02969 | 0.090418 | 0.192982 | 0.665317 | |
| Overall Probability of | <i>Moving Up</i> | 0.3145 | <i>Moving Down</i> | 0.2523 | | |

The Classic Markov Matrices showcase a high degree of persistence on the tails of the distribution (quantiles 1 and 5). Moreover, it can be seen that probabilities in the upper triangle are higher than those on the lower triangle. This fact translates into a higher probability of moving up. However, as we will see shortly, Classic Markov Matrices do not convey a good enough picture.

Kernel Distributions: Language

The classic kernel distribution shows signs of stability, as it barely moves to the left.

The kernel contour map essentially follows the diagonal line, and the mass of the distribution concentrates at the center of the graph.

Both facts are clear signs of persistence of the education quality distribution. Namely, there is no convergence.

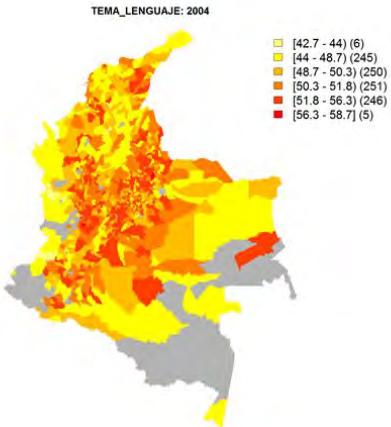

Classic Markov Matrix: Language

| Language | | 1 | 2 | 3 | 4 | 5 |
|------------------------|-----------|----------|-------------|----------|----------|---|
| Probability Matrix | | | | | | |
| 1 | 0.503305 | 0.274788 | 0.133144 | 0.063267 | 0.025496 | |
| 2 | 0.291139 | 0.285297 | 0.225901 | 0.148004 | 0.049659 | |
| 3 | 0.160156 | 0.25 | 0.292969 | 0.207031 | 0.089844 | |
| 4 | 0.069676 | 0.158979 | 0.245339 | 0.314033 | 0.211973 | |
| 5 | 0.037365 | 0.076696 | 0.112094 | 0.241888 | 0.531957 | |
| Overall Probability of | Moving up | 0.2878 | Moving down | 0.3261 | | |

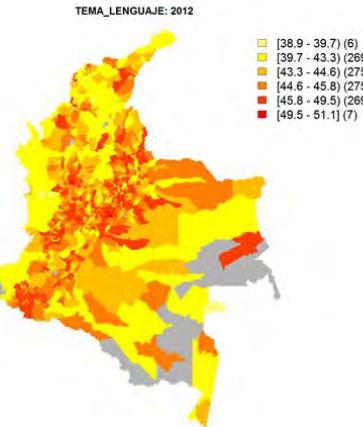

The kernel distribution above showcased a slight movement to the left. This fact is reflected in the higher global probability of moving down. Moreover, municipalities at the third or second quantiles are the ones with the highest chances of declining. Conversely, municipalities in the fourth and fifth quintiles have a much lower probability of moving down the distribution.

ESDA: Boxmaps

Boxmap Language, 2004

Boxmap Language, 2012

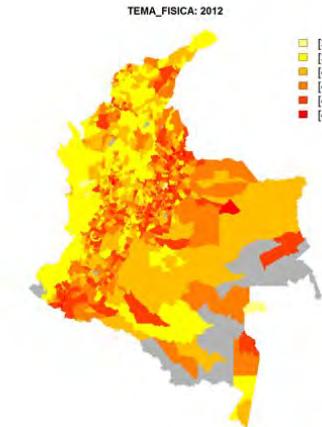

Areas with low education quality are located in the west (Pacific) coast and the north (Atlantic) coast.

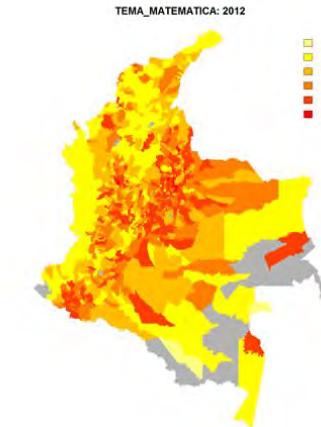

Conversely, municipalities with a high education quality locate in the interior Andean region.

ESDA: Boxmaps

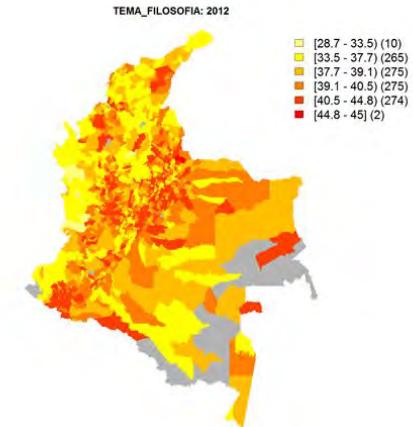

Boxmap Physics, 2012

Boxmap Mathematics, 2012

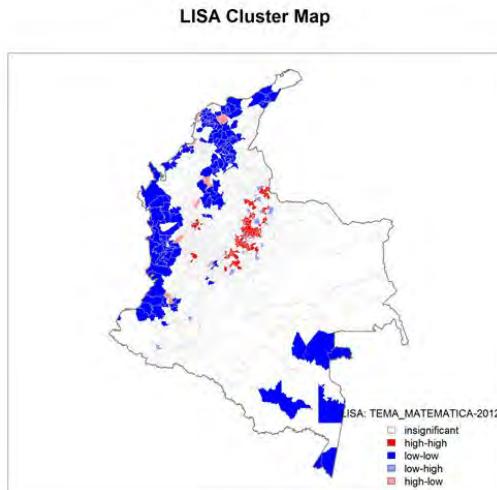

Boxmap Philosophy, 2012

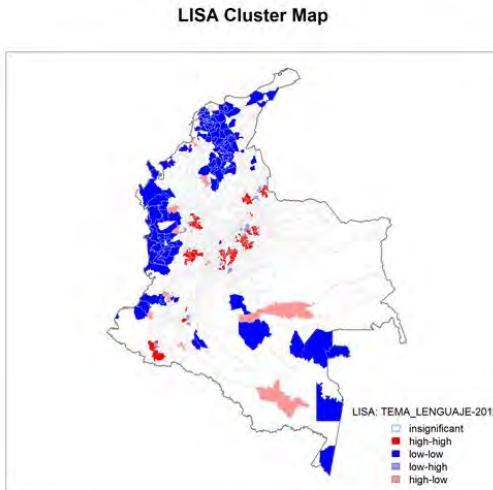

Spatial patterns are pretty robust.

ESDA: Cluster Maps

Mathematics, 2012

Language, 2012

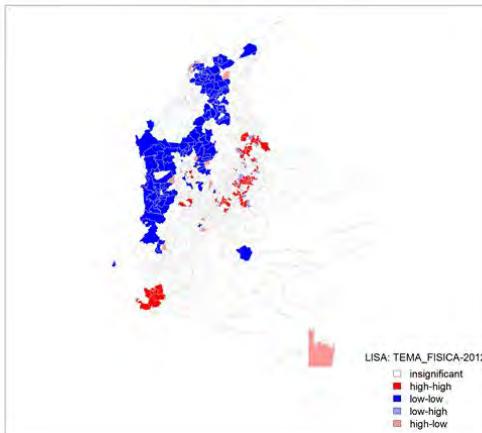

The boxmaps before suggest the presence of pockets of positive spatial association, namely, municipalities cluster together in neighbourhoods of a similar education quality level.

The Local Indicators of Spatial Association (LISA) confirm this hypothesis, as the cluster maps show.

ESDA: Cluster Maps

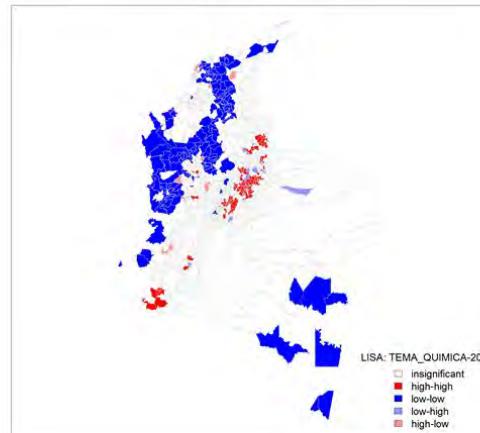

Physics, 2012

LISA Cluster Map

Chemistry, 2012

LISA Cluster Map

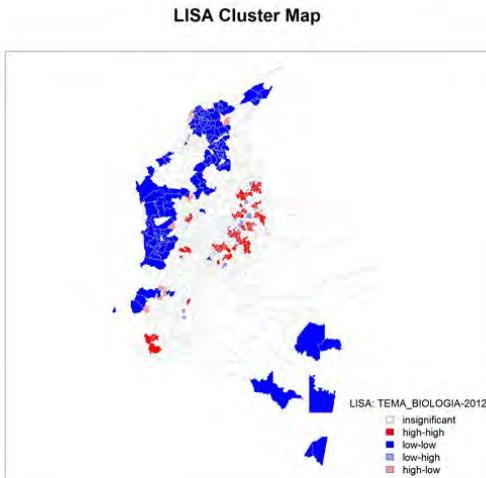

Indeed, the Low-Low clusters or neighbourhoods of low education quality comprise the west (Pacific) and north (Atlantic) coasts.

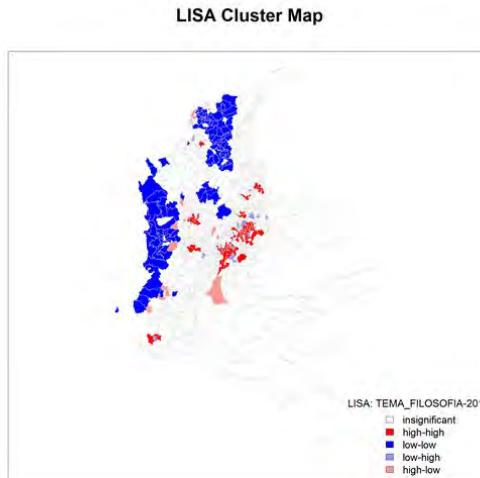

It is a little bit surprising that Cali's metro area, the third most important urban agglomeration in Colombia, is classified in this cluster.

ESDA: Cluster Maps

Biology, 2012

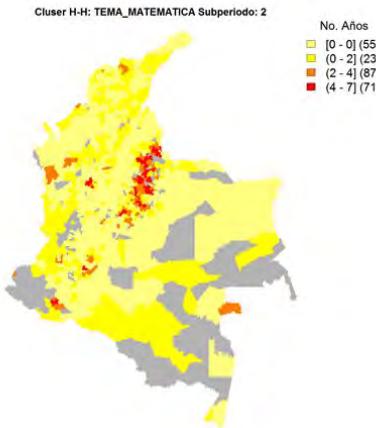

Philosophy, 2012

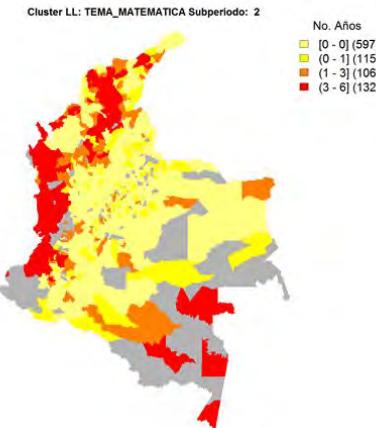

The High-High clusters or neighbourhoods of high education quality are located mainly around Colombia's two main cities -Medellín and Bogotá- and around the Eastern Andean mountain range.

ESDA: Persistence Maps

Mathematics: persistence of the high-high cluster

Mathematics: persistence of the low-low cluster

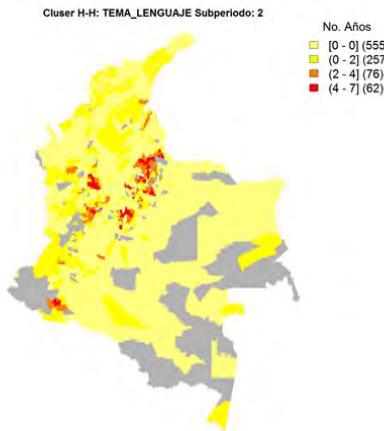

Areas in the high-high cluster $\frac{2}{3}$ (or more) of the time:

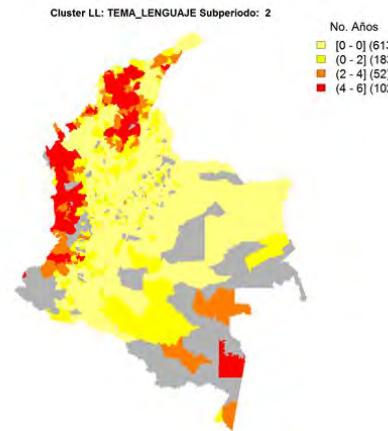

- Bogotá's metro area
- Medellín's metro area
- Bucaramanga's metro area

ESDA: Persistence Maps

Language: persistence of the high-high cluster

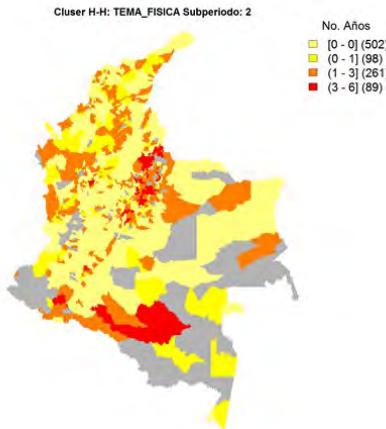

Language: persistence of the low-low cluster

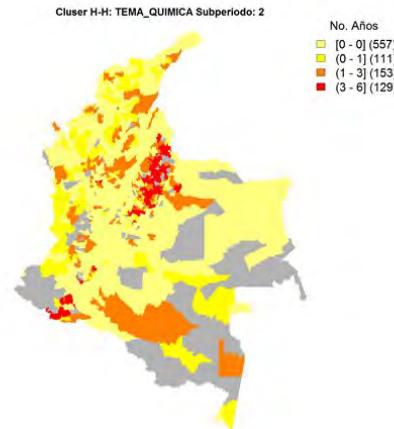

The periphery in terms of education quality again is located persistently in the Pacific (west coast) and Atlantic (northern coast) regions. These are classified in the low-low cluster half the time or more.

ESDA: Persistence Maps

Physics: persistence of the high-high cluster

Chemistry: persistence of the low-low cluster

Persistence maps show clearly that there are no signs of convergence.

Spatial Markov Matrices: Math

| Overall Probability of: | Moving up | 0.262 | Moving down | 0.31 | |

Convergence club: the probability of moving down when the neighbours showcase a low education quality (quantile 1 or 2) surpasses the probability of moving up.

Note, for instance, that a municipality in the third quantile, which is surrounded by neighbours in the first quantile, has a meager 3.4% chance of climbing to the fifth quantile.

Spatial Markov Matrices: Math

| Neighbourhood's education quality quantile: 4 | | 1 | 2 | 3 | 4 | 5 |

| 5 | 0.019 | 0.032 | 0.101 | 0.253 | 0.595 | |
| Overall Probability of: <i>Moving up</i> | | 0.3 | <i>Moving down</i> | 0.275 | | |
| Neighbourhood's education quality quantile: 5 | | | | | | |
| Probability Matrix | | 1 | 2 | 3 | 4 | 5 |
| 1 | 0.091 | 0.545 | 0.273 | 0 | 0.091 | |
| 2 | 0.125 | 0.25 | 0.219 | 0.234 | 0.172 | |
| 3 | 0.032 | 0.126 | 0.232 | 0.4 | 0.211 | |
| 4 | 0.026 | 0.125 | 0.184 | 0.322 | 0.342 | |
| 5 | 0.03 | 0.033 | 0.089 | 0.155 | 0.694 | |
| Overall Probability of: <i>Moving up</i> | | 0.27 | <i>Moving down</i> | 0.265 | | |

In contrast, a municipality in the third quantile and surrounded by neighbours in the fifth quantile has a 21.1% probability of moving up to that quantile.

In a neighbourhood of medium or high education quality, the overall probability of improving surpasses the probability of going down.

Ergodic (long run) distribution: Math

Initial Distribution

| Matemática | 1 | 2 | 3 | 4 | 5 |
|-----------------|-------|-------|-------|-------|-------|
| Neighbourhood 1 | 0.404 | 0.337 | 0.169 | 0.079 | 0.011 |
| Neighbourhood 2 | 0.190 | 0.332 | 0.239 | 0.185 | 0.054 |
| Neighbourhood 3 | 0.057 | 0.281 | 0.250 | 0.318 | 0.094 |
| Neighbourhood 4 | 0.058 | 0.168 | 0.318 | 0.295 | 0.162 |
| Neighbourhood 5 | 0.000 | 0.080 | 0.280 | 0.370 | 0.270 |

Long run Distribution

| Matemática | 1 | 2 | 3 | 4 | 5 |
|-----------------|-------|-------|-------|-------|-------|
| Neighbourhood 1 | 0.636 | 0.2 | 0.063 | 0.061 | 0.04 |
| Neighbourhood 2 | 0.269 | 0.224 | 0.232 | 0.174 | 0.101 |
| Neighbourhood 3 | 0.124 | 0.224 | 0.257 | 0.203 | 0.192 |
| Neighbourhood 4 | 0.075 | 0.137 | 0.184 | 0.258 | 0.347 |
| Neighbourhood 5 | 0.043 | 0.117 | 0.157 | 0.235 | 0.449 |

63.6% of municipalities surrounded by a neighbourhood of very low education quality would end up in that situation..

44.9% of municipalities surrounded by neighbours in the upper quantile would end up with a very high education quality.

This adds support to the convergence clubs hypothesis.

Likewise, here we find that seen that the neighbourhood effect is important, as it determines the probability of moving up or down the distribution.

Ergodic (long run) distribution: Math

Initial Distribution

| Lenguaje | Subperiodo 2 | 1 | 2 | 3 | 4 | 5 |
|-----------------|--------------|-------|-------|-------|-------|---|
| Neighbourhood 1 | 0.493 | 0.226 | 0.116 | 0.089 | 0.075 | |
| Neighbourhood 2 | 0.235 | 0.255 | 0.275 | 0.137 | 0.098 | |
| Neighbourhood 3 | 0.063 | 0.271 | 0.285 | 0.264 | 0.118 | |
| Neighbourhood 4 | 0.085 | 0.148 | 0.211 | 0.317 | 0.239 | |
| Neighbourhood 5 | 0.065 | 0.124 | 0.163 | 0.288 | 0.359 | |

Long run Distribution

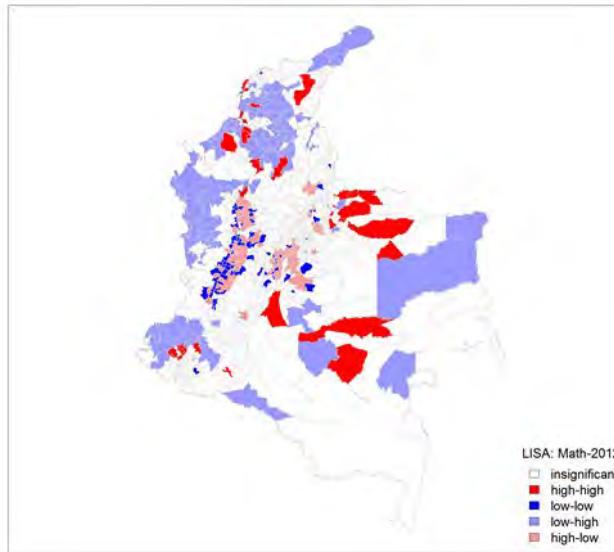

| Lenguaje | Subperiodo 2 | 1 | 2 | 3 | 4 | 5 |
|-----------------|--------------|-------|-------|-------|-------|---|
| Neighbourhood 1 | 0.518 | 0.238 | 0.118 | 0.09 | 0.036 | |
| Neighbourhood 2 | 0.181 | 0.228 | 0.225 | 0.211 | 0.155 | |
| Neighbourhood 3 | 0.144 | 0.239 | 0.245 | 0.21 | 0.162 | |
| Neighbourhood 4 | 0.079 | 0.164 | 0.219 | 0.263 | 0.275 | |
| Neighbourhood 5 | 0.064 | 0.125 | 0.214 | 0.243 | 0.354 | |

In the long run $51.8\% + 23.8 = 75.6\%$ of municipalities would end up in the two lower quintiles, if their neighbours belong to the lowest quintile.

Conversely, those municipalities surrounded by neighbourhoods in the highest quintile would end up mostly in two upper quintiles ($24.3\% + 35.4\% = 59.5\%$).

Concluding Remarks

- Generally speaking, it can be seen that kernel distributions move slightly or get flatter (because of increased dispersion).
- Moreover, although classic Markov Matrices showcase a high mobility in intermediate quantiles, it can be seen that the probabilities of staying in extreme quantiles are pretty high.
 - The highest barriers to mobility are on the tails of the distribution, not in its center.
- Hence, it is clear that kernel distributions and classic Markov Matrices do not support the convergence hypothesis among municipalities in terms of education quality in Colombia.

Concluding Remarks

- The spatial distribution of municipal education quality shows sharp patterns. It is clear that municipalities in the west (Pacific) coast and the north (Atlantic) coast have the lowest education quality levels. Conversely, municipalities with a high education quality are located around Colombia's big cities on the Andean region.
- Results suggest that location has a heavy influence on the chances a municipality has of improving or declining in terms of education quality. For instance, a municipality with a high education quality neighbourhood has a lower chance of moving down and an increased chance of moving up in education's quality distribution.
- Finally, results show a high degree of overlap between areas of high poverty and low education quality. The overlap with areas of high economic activity is weaker.

Thanks!

Para los municipios en el cuantil inferior no deja de ser ventajoso tener buenos vecinos, es decir, vecinos de alto desempeño educativo, puesto que sus chances de escalar son apreciables bajo este escenario (del 80%).

Distribución de largo plazo: Física

Distribución Inicial

| Física | Subperiodo 2 | 1 | 2 | 3 | 4 | 5 |
|---------------------|--------------|-------|-------|-------|-------|---|
| Vecindario 1 | 0.336 | 0.350 | 0.161 | 0.109 | 0.044 | |
| Vecindario 2 | 0.172 | 0.357 | 0.185 | 0.191 | 0.096 | |

Presentan las mejores chances de escalar aquellos municipios en vecindarios de alto y muy alto rendimiento educativo, lo que va en dirección de un proceso general de ampliamento de las disparidades regionales en el desempeño educativo.

Distribución de largo plazo: Biología

Distribución Inicial

| Biología | Subperiodo 2 | 1 | 2 | 3 | 4 | 5 |
|--------------|--------------|-------|-------|-------|-------|---|
| Vecindario 1 | 0.477 | 0.292 | 0.085 | 0.085 | 0.062 | |
| Vecindario 2 | 0.188 | 0.365 | 0.218 | 0.141 | 0.088 | |
| Vecindario 3 | 0.048 | 0.361 | 0.265 | 0.247 | 0.078 | |
| Vecindario 4 | 0.039 | 0.195 | 0.338 | 0.240 | 0.188 | |
| Vecindario 5 | 0.042 | 0.119 | 0.263 | 0.212 | 0.364 | |

Distribución Egódica

| Biología | Subperiodo 2 | 1 | 2 | 3 | 4 | 5 |
|--------------|--------------|-------|-------|-------|-------|---|
| Vecindario 1 | 0.628 | 0.226 | 0.073 | 0.042 | 0.03 | |
| Vecindario 2 | 0.224 | 0.269 | 0.237 | 0.174 | 0.097 | |
| Vecindario 3 | 0.118 | 0.202 | 0.253 | 0.238 | 0.189 | |
| Vecindario 4 | 0.055 | 0.142 | 0.216 | 0.271 | 0.316 | |
| Vecindario 5 | 0.039 | 0.092 | 0.159 | 0.249 | 0.461 | |

La hipótesis del club de convergencia no parece ser contradicha por la distribución ergódica en la tabla, puesto que en el vecindario inferior el 85.4% de los municipios se ubican en los dos cuantiles de bajo desempeño, mientras el 71% de los municipios en vecindarios de alto desempeño educativo se ubican en las dos categorías superiores.
